

RAPID™ Payment Processing System

Informatix' **RAPID™** suite of products provides highly-accurate remittance processing.

Process Complex Remittances with Ease

The RAPID™ system integrates hardware and image-based workflow software, leveraging the latest technology to:

- Reduce manual processes
- Decrease the risk of theft
- Increase accountability
- Tighten system controls
- Increase worker efficiency
- Support flexible work distribution

The Old Way: Vertical Silos

Most remittance processing software uses vertical silos to present a batch of work to an individual staff member. As a result, *any anomalies, like correspondence, slow down payment processing.*

The RAPID™ Way: Simultaneous Processing

RAPID™ features a parallel workflow that allows special tasks, like correspondence, to occur simultaneously with payment processing. RAPID™ accomplishes this through a true, envelope-based workflow system. RAPID™ processes all work at the envelope level, including reconciliation and deposit preparation. The RAPID™ Workflow Manager keeps track of each envelope – from the moment the image is received via the scanning interface until it is transferred to the target system. The RAPID™ Workflow Manager creates an audit trail, capturing and storing detailed information including User ID, date/time stamp and action. The audit trail remains intact even after export to the Image Archive and throughout the life of the image.

The Bottom Line

The RAPID™ system's fast, accurate payment processing reduces human error, frees up resources, improves your customer service, and moves payments into your bank account sooner. We would be glad to meet with you to discuss how RAPID™ can meet the needs of your organization.

RAPID™

RAPID™ Features

EFT Payments

RAPID™ supports processing EFTs through our Foreign Systems Interface. RAPID™ brings EFT into the normal processing stream so you can apply the same business rules you use for paper payments. Consolidated reports provide a real-time picture of work received, pending, and completed.

Web Payments

The RAPID™ Web Payment application allows your customers to make payments via the web from their bank accounts. The RAPID™ Web Payment application is configurable to your needs and meets NACHA standards and formats.

Image Archive

The RAPID™ Image Archive stores images for fast and reliable web-based retrieval. Informatix customizes Image Archive according to your needs. The Image Archive includes a full audit trail that shows the "who," "what," and "when" for every action related to an image from its capture until it is purged.

OPEX Interface

RAPID™ integrates with the industry leader for mail-opening and image capture – the OPEX 3690i. This single stage mail-opening and imaging hardware and software solution is the de facto standard for the complex remittance processing market.

It's called RAPID for a reason!

iScanIt™ For Low-Volume Payment Processing

iScanIt™

Informatix designed iScanIt™ scanning interface software for lower-volume payment processing needs. iScanIt™ works with TWAIN and JTWAIN compliant scanners and interfaces with bill or payment processing systems using XML or other standard formats. iScanIt™ has an intuitive user interface which uses touch-screen technology to correlate images from the scanner with a virtual envelope. Once the check and remittance images are associated, they can be processed as a unit, making this system ideal for bill and payment processing.
